

## Automata and Formal Languages — Homework 3

Due 04.11.2016

### Exercise 3.1

Let  $A$  and  $B$  be respectively the following DFAs:

- Compute the language partitions of  $A$  and  $B$ .
- Construct the quotients of  $A$  and  $B$  with respect to their language partitions.
- Give regular expressions for  $L(A)$  and  $L(B)$ .

### Exercise 3.2

A DFA  $A = (Q, \Sigma, \delta, q_0, F)$  is *reversible* if no letter can enter a state from two distinct states, i.e. for every  $p, q \in Q$  and  $\sigma \in \Sigma$ , if  $\delta(p, \sigma) = \delta(q, \sigma)$ , then  $p = q$ .

- Give a reversible DFA that accepts  $L = \{ab, ba, bb\}$ .
- Show that the minimal DFA accepting  $L$  is not reversible.
- Is there a unique minimal reversible DFA accepting  $L$  (up to isomorphism)? Justify your answer.

**Exercise 3.3**

Let  $A$  and  $B$  be respectively the following NFAs:

- (a) Compute the coarsest stable refinements (CSR) of  $A$  and  $B$ .
- (b) Construct the quotients of  $A$  and  $B$  with respect to their CSRs.
- (c) Are the obtained automata minimal?

**Exercise 3.4**

Convert the following NFA- $\epsilon$  to an NFA using the algorithm  $NFA_{\epsilon}toNFA$  from the lecture notes (see Sect. 2.3, p. 31). You may verify your answer with the Python program `nfa-eps2nfa`.

**Solution 3.1**

A) (a)

| Iter. | Block to split                     | Splitter       | New partition                                   |
|-------|------------------------------------|----------------|---|
| 0     | —                                  | —              | $\{q_0, q_1, q_2, q_3, q_5, q_6\}, \{q_4\}$     |
| 1     | $\{q_0, q_1, q_2, q_3, q_5, q_6\}$ | $(b, \{q_4\})$ | $\{q_0, q_2, q_6\}, \{q_1, q_3, q_5\}, \{q_4\}$ |
| 2     | none, partition is stable          | —              | —   |

The language partition is  $P_\ell = \{\{q_0, q_2, q_6\}, \{q_1, q_3, q_5\}, \{q_4\}\}$ .

(b)

(c)  $(a + b)^*ab$ .

B) (a)

| Iter. | Block to split            | Splitter                 | New partition                             |
|-------|---------------------------|--------------------------|---|
| 0     | —                         | —                        | $\{q_0, q_3\}, \{q_1, q_2, q_4\}$         |
| 1     | $\{q_1, q_2, q_4\}$       | $(b, \{q_1, q_2, q_4\})$ | $\{q_0, q_3\}, \{q_1\}, \{q_2, q_4\}$     |
| 2     | $\{q_2, q_4\}$            | $(a, \{q_0, q_3\})$      | $\{q_0, q_3\}, \{q_1\}, \{q_2\}, \{q_4\}$ |
| 3     | none, partition is stable | —                        | —   |

The language partition is  $P_\ell = \{\{q_0, q_3\}, \{q_1\}, \{q_2\}, \{q_4\}\}$ .

(b)

(c)  $((aa)^*(bb)^*)^*$  or  $(aa + bb)^*$ .

**Solution 3.2**

(a)

(b) By minimizing the previous reversible DFA, we obtain the following DFA which is not reversible since  $b$  enters the final state twice.

(c) No. The two following non isomorphic automata are both minimal reversible DFAs accepting  $L$ .

Note that, even though minimal reversible DFAs need not to be unique, testing whether a reversible DFA is minimal, and minimizing reversible DFAs can both be done in polynomial time. [1].

**Solution 3.3**

A) (a)

| Iter. | Block to split                | Splitter       | New partition                              |
|-------|-------------------------------|----------------|--|
| 0     | —                             | —              | $\{q_0, q_1, q_2, q_3, q_4\}, \{q_5\}$     |
| 1     | $\{q_0, q_1, q_2, q_3, q_4\}$ | $(a, \{q_5\})$ | $\{q_0\}, \{q_1, q_2, q_3, q_4\}, \{q_5\}$ |
| 2     | none, partition is stable     | —              | —  |

The CSR is  $P = \{\{q_0\}, \{q_1, q_2, q_3, q_4\}, \{q_5\}\}$ .

(b)

(c) Yes. The language accepted by the NFA is  $L = a(a+b)^*a$ . An NFA with one state can only accept  $\emptyset, \{\varepsilon\}, a^*, b^*$  and  $\{a, b\}^*$ . Suppose there exists an NFA  $A = (\{q_0, q_1\}, \{a, b\}, \delta, Q_0, F)$  accepting  $L$ . Without loss of generality, we may assume that  $q_0$  is initial.  $A$  must respect the following properties:

- $q_0 \notin F$ , since  $\varepsilon \notin L$ ,
- $q_1 \in F$ , since  $L \neq \emptyset$ ,
- $q_1 \in \delta(q_0, a)$ , otherwise it is impossible to accept  $aa$  which is in  $L$ .

This implies that  $A$  accepts  $a$ , yet  $a \notin L$ . Therefore, no two states NFA accepts  $L$ .  $\square$

B) (a)

| Iter. | Block to split            | Splitter            | New partition                        |
|-------|---------------------------|---------------------|--------------------------------------|
| 0     | —                         | —                   | $\{q_1, q_3\}, \{q_2, q_4\}$         |
| 1     | $\{q_1, q_3\}$            | $(a, \{q_2, q_4\})$ | $\{q_1\}, \{q_2, q_4\}, \{q_3\}$     |
| 2     | $\{q_2, q_4\}$            | $(a, \{q_3\})$      | $\{q_1\}, \{q_2\}, \{q_3\}, \{q_4\}$ |
| 3     | none, partition is stable | —                   | —                                    |

The CSR is  $P = \{\{q_1\}, \{q_2\}, \{q_3\}, \{q_4\}\}$ .

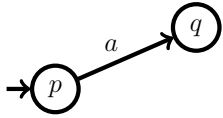

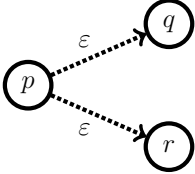

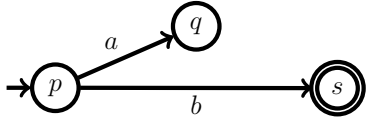

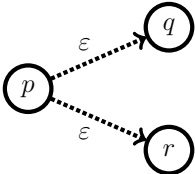

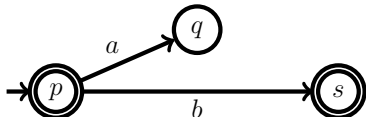

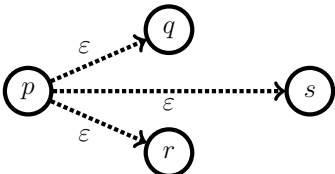

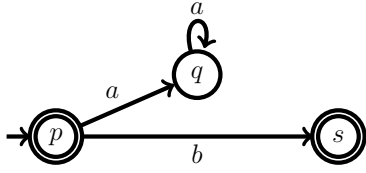

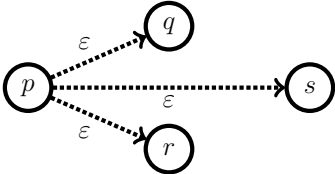

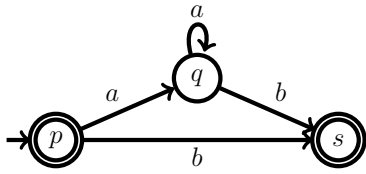

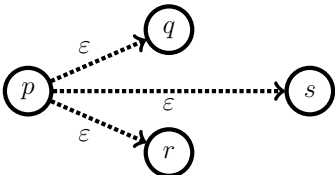

(b) The automaton remains unchanged.

(c) No. We have seen that this NFA accepts  $(a+ab)^*$  in #2.1 of the second exercise sheet, and we have constructed a two states DFA for this language:

### Solution 3.4

| Iter. | $B = (Q', \Sigma, \delta', Q'_0, F')$ | $\delta''$ ( $\varepsilon$ -transitions) | Workset $W$ and next $(q_1, \alpha, q_2)$       |
|-------|---------------------------------------|--|---|
| 0     |                                       |  | $\{(p, \varepsilon, q), (p, \varepsilon, r)\}$  |
| 1     |                                       |  | $\{(p, \varepsilon, r), (p, a, q), (p, b, s)\}$ |
| 2     |                                       |  | $\{(p, a, q), (p, b, s), (p, \varepsilon, s)\}$ |

|   |  |   |  |
|---|--|---|--|
| 3 |   |    | $\{(p, b, s), (p, \varepsilon, s), (q, a, q), (q, b, s)\}$ |
| 4 |   |    | $\{(p, \varepsilon, s), (q, a, q), (q, b, s)\}$            |
| 5 |   |   | $\{(q, a, q), (q, b, s)\}$                                 |
| 6 |   |   | $\{(q, b, s)\}$  |
| 7 |  |  | $\emptyset$  |

The NFA  $B$  obtained is:

which corresponds to the output of `nfa-eps2nfa`:

```

Q' = set(['q', 'p', 's'])
S = set(['a', 'b'])
d' = set([( 'p', 'a', 'q' ), ( 'q', 'b', 's' ), ( 'q', 'a', 'q' ), ( 'p', 'b', 's' )])
Q0' = set(['p'])
F' = set(['p', 's'])

```
