Petri nets — Homework 4

Due 05.06.2018

Exercise 4.1

(a) Show that

$$X = \left\{ (x_1, x_2, x_3) \in \mathbb{N}^3 : (x_1 + 3 \le x_2 \le x_3 + 1) \lor (x_2 = 2x_1 + x_3 + 5) \right\}$$

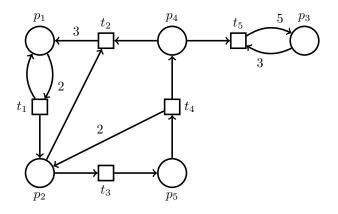

is semilinear by giving its representation as a finite set of roots and periods.

(b) Give a Petri net whose reachability set equals X up to a projection. More precisely, give a Petri net (with weights) $\mathcal{N} = (P, T, W)$ such that $\{p_{\text{init}}, p_1, p_2, p_3\} \subseteq P$ and

$$\{p_{\text{init}}\} \xrightarrow{*} M \text{ and } M(p_{\text{init}}) = 0 \iff (M(p_1), M(p_2), M(p_3)) \in X.$$

Exercise 4.2

Consider the following Petri net (with weights) \mathcal{N} :

- (a) Build the incidence matrix of \mathcal{N} .
- (b) Let $M_0 = \{p_1, p_1\}$. Try to determine whether

$$M_0 \stackrel{*}{\to} \{p_1, p_1, p_1, p_4\},$$

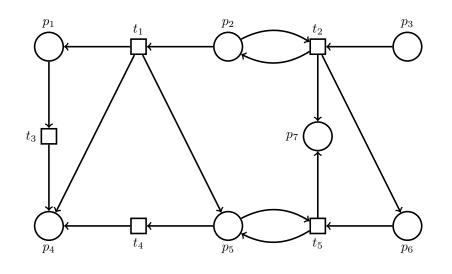

$$M_0 \stackrel{*}{\to} \{p_1, p_1, p_1, p_1, p_2\},$$

$$M_0 \stackrel{*}{\to} \{p_1, p_2, p_5\},$$

by solving the marking equation.

(c) Does $\{p_1, p_5\} \xrightarrow{*} \{p_2, p_2, p_2, p_4\}$? Prove your answer.

Exercise 4.3 Consider the following Petri net $\mathcal{N} = (P, T, F)$:

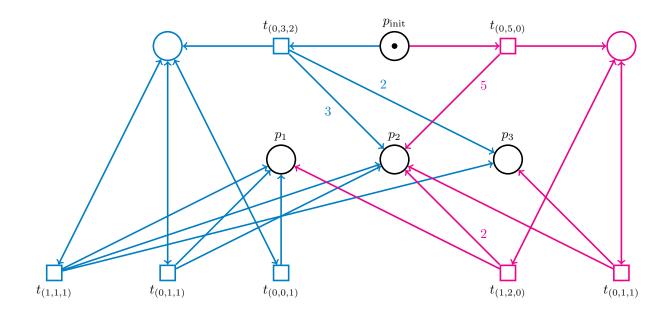

- (a) Give a basis of the vector space of S-invariants of \mathcal{N} . [Hint:
- (b) Let $M = \{p_1, p_2, p_4, p_4\}$ and $M' = \{p_1, p_3, p_5\}$. Using (a), can you tell whether (\mathcal{N}, M) and (\mathcal{N}, M') are bounded? live?

Solution 4.1

(a)

$$X = (0,3,2) + \mathbb{N} \cdot (1,1,1) + \mathbb{N} \cdot (0,1,1) + \mathbb{N} \cdot (0,0,1) \cup (0,5,0) + \mathbb{N} \cdot (1,2,0) + \mathbb{N} \cdot (0,1,1)$$

(b)

Solution 4.2

(a)

 \star This can be verified using PIPE by loading the Petri net, clicking on "Incidence & Marking" in the left menu, and comparing with the "Combined incidence matrix".

(b) Let us first write the markings as vectors:

$$M_0 = \begin{pmatrix} 2\\0\\0\\0\\0 \end{pmatrix}, \quad M_1 = \begin{pmatrix} 3\\0\\0\\1\\0 \end{pmatrix}, \quad M_2 = \begin{pmatrix} 4\\1\\0\\0\\0 \end{pmatrix}, \quad M_3 = \begin{pmatrix} 1\\1\\0\\0\\1 \end{pmatrix}.$$

We need to solve $M_i = M_0 + \mathbf{N} \cdot X$, for each $i \in \{1, 2, 3\}$, which is equivalent to solving $\mathbf{N} \cdot X = M_i - M_0$. All three systems of equations can be solved simultaneously by using Gaussian elimination:

$$\begin{pmatrix} -1 & 3 & 0 & 0 & 0 & | & 1 & 2 & -1 \\ 1 & -1 & -1 & 2 & 0 & | & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 & 2 & | & 0 & 0 & 0 \\ 0 & -1 & 0 & 1 & -1 & | & 1 & 0 & 0 \\ 0 & 0 & 1 & -1 & 0 & | & 0 & 0 & 1 \end{pmatrix} \sim \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & | & -1 & 1 & 2 \\ 0 & 1 & 0 & 0 & 0 & | & 0 & 1 & 1/3 \\ 0 & 0 & 1 & 0 & 0 & | & 1 & 1 & 4/3 \\ 0 & 0 & 0 & 1 & 0 & | & 1 & 1 & 1/3 \\ 0 & 0 & 0 & 0 & 1 & | & 0 & 0 & 0 \end{pmatrix}$$

Markings M_1 and M_3 are not reachable from M_0 since their associated (unique) solutions contain respectively negative and non integer values. Since the marking equation for M_2 has a non negative integer solution, we cannot conclude whether M_2 can be reached or not. In fact, a closer look at the Petri net shows that it is reachable since $M_0 \xrightarrow{t_1 t_3 t_4 t_2} M_2$.

(c) Let us first write the markings as vectors:

$$M_0 = \begin{pmatrix} 1\\0\\0\\0\\1 \end{pmatrix}, \quad M = \begin{pmatrix} 3\\0\\0\\1\\0 \end{pmatrix}.$$

Let us solve the marking equation $N \cdot X = M - M_0$:

$$\begin{pmatrix} -1 & 3 & 0 & 0 & 0 & | & -1 \\ 1 & -1 & -1 & 2 & 0 & | & 3 \\ 0 & 0 & 0 & 0 & 2 & | & 0 \\ 0 & -1 & 0 & 1 & -1 & | & 1 \\ 0 & 0 & 1 & -1 & 0 & | & -1 \end{pmatrix} \sim \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & | & 1 \\ 0 & 1 & 0 & 0 & 0 & | & 0 \\ 0 & 0 & 1 & 0 & 0 & | & 0 \\ 0 & 0 & 0 & 1 & 0 & | & 1 \\ 0 & 0 & 0 & 0 & 1 & | & 0 \end{pmatrix}$$

As there exists a non negative integer solution, we cannot conclude anything immediately. Let us analyze the solution more carefully. Transitions t_1 and t_4 must be fired exactly once, and all other transitions must not be fired. Transition t_1 is disabled in M_0 , so t_4 must be fired first, leading to the marking $\{p_1, p_2, p_2, p_4\}$. Transition t_1 is still disabled in this marking, which implies that M is not reachable.

Solution 4.3

(a) Recall that I is an S-invariant if and only if $\sum_{p \in \bullet_t} I(p) = \sum_{p \in t^{\bullet}} I(p)$ for every $t \in T$. This gives rise to the following system of equations:

$$I(p_2) = I(p_1) + I(p_4) + I(p_5),$$

$$I(p_2) + I(p_3) = I(p_2) + I(p_6) + I(p_7),$$

$$I(p_1) = I(p_4),$$

$$I(p_5) = I(p_4),$$

$$I(p_5) + I(p_6) = I(p_5) + I(p_7),$$

which is equivalent to:

$$I(p_2) = 3 \cdot I(p_1),$$

$$I(p_3) = 2 \cdot I(p_6),$$

$$I(p_4) = I(p_1),$$

$$I(p_5) = I(p_1),$$

$$I(p_7) = I(p_6).$$

Therefore, each S-invariant I is fully determined by $I(p_1)$ and $I(p_6)$, and hence the vector space of S-invariants is given by:

 $x \cdot (1 \quad 3 \quad 0 \quad 1 \quad 1 \quad 0 \quad 0) + y \cdot (0 \quad 0 \quad 2 \quad 0 \quad 0 \quad 1 \quad 1) \quad \text{for } x, y \in \mathbb{Q}.$

 \star This can be verified using PIPE by loading the Petri net and clicking on "Invariant Analysis" in the left menu.

(b) If a Petri net has a positive S-invariant, then it is bounded from any initial marking. By (a), taking x, y > 0 yields a positive S-invariants, e.g. $\begin{pmatrix} 1 & 3 & 2 & 1 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ obtained by taking x = y = 1. Therefore, \mathcal{N} is bounded both from M and M'.

Assume that (\mathcal{N}, M) is live, then $I \cdot M > 0$ for every semi-positive S-invariant I. By (a), semi-positive S-invariants of \mathcal{N} are obtained by taking $x, y \ge 0$ and x + y > 0. Therefore, we have

/ \

$$\begin{pmatrix} 1 & 1 & 0 & 2 & 0 & 0 & 0 \end{pmatrix} \cdot \begin{pmatrix} x \\ 3x \\ 2y \\ x \\ x \\ y \\ y \end{pmatrix} = 5x$$

When x = 0, we have 5x = 0 which contradicts the fact that (\mathcal{N}, M) is live. Therefore, it is not live. Let us do the same calculations for M':

$$\begin{pmatrix} 1 & 0 & 1 & 0 & 1 & 0 & 0 \end{pmatrix} \cdot \begin{pmatrix} x \\ 3x \\ 2y \\ x \\ y \\ y \\ y \end{pmatrix} = 2x + 2y$$

Since x + y > 0, we have 2x + 2y = 2(x + y) > 0. This implies that $I \cdot M' > 0$ for every semi-positive S-invariant I. Therefore, we cannot conclude whether (\mathcal{N}, M') is live or not.
